Alright I’m Lindsey and I’m just showing you the tracker system. And this is alternative mouse device for people who don’t have use of their hands or have very limited use so they can use, they may only have use of moving their head. So they can use that to be able to control the computer. And so for the tracker device it’s strapped right up here on top of this screen and you put a Teflon dot on your head so it going to tracker where you point your head. It’s tracker with this right here and using the onscreen keyboard you can hover over these letters. If it’s tracking you can hover over that letter and all these start out dark so as you hold them over there for a few seconds it phases out. So when it is done it will type the letter up there.

And another feature of the on screen keyboard it’s going to do predicted texts. So if you type in something that you have typed before it will give you some options up here at the top. Usually words that maybe you’re trying to spell and you can choose those. So this is the Teflon dot, you put it right there in the center of your forehead and then just move your head. It takes some getting used to, it’s usually better if you can sit up closer to the screen so you don’t have to move your head quite as much. It’s also better if you use a high backed chair to support your head that way you don’t get any neck injuries trying to move your head and hold it in certain ways. So if it’s tracking me I can say…hover over “m” and it types a “m” for me and that’s how at least you can use word processing using the head-tracker device.
