WYNN

“I’m Bob. I’m going to be demonstrating the WYNN software for today. WYNN is very good for students that have problems with dyslexia, ADHD, also some writing difficulties, and aphasia. It’s very useful, very easy to utilize in different ways, it’s very user friendly, and one of the nice things it does is that it actually has text to speech which is easy to customize. I’ll go ahead get into it now. Okay we are opening the WYNN Literacy Software. We are going to sign in as guest user. This is so different people can have their own profiles in here, things they are working with. And this is the start off with different tool bars color coded. The Blue tool bar is where we start off with which helps us manage the files. We can create new files, open files, close them. This file we have open right here talks about the WYNN software and what we’re going to do is actually read it. So we go to the next toolbar and here is where we can read.”

“The next button to the toolbar button is the read button. This will highlight the word and read it. And as we go through the text (Computer talking) and what we can do here is we can change the size of the font, make it larger, we can make it smaller. We can change the spacing from the words uh between the words so it’s more easily distinguishable, the gap between each word. We can change the line spacing. We can change the margins; we can also change the color of the background, and the text itself to whatever is most comfortable for the user to use. And we can also change the rate of how fast it talks or how slow it talks.”

“Okay the next toolbar is the pink toolbar which helps us study and learn. We can also read form here. (Computer talking) We can also highlight a word in here, go to dictionary (Computer Talking: Feature. Noun. 2. A prominent characteristic, trait, or quality. The best feature of the house). It will help us spell words and it will help us…(Computer talking: “ Features. F.E.A.T.U.R.E.S - Features.”)

“The next toolbar is the yellow toolbar which helps us with writing. Here we can cut and paste, we can change the style, we can use it to find words , and we can make outlines. There is also homophone and we can go down to our basic- sort of the lexicon of the different words that are available and it will tell us for example, I had highlighted the word new N.E.W, it brings up other words that sound like that such as G.N.U, K.N.E.W as well as N.E.W. And it gives the definition of each of those words. Okay that is a basic brief overview of the main features of WYNN.”
